Photivo

Brief Description:

Photivo is not just mentioned as photo editing application, it is also known as a photo processor. This application handles mega data and converts RAW format files along with usual files like TIFF, JPEG, BMP and PNG in a non-destructive, 16-bit processing pipe. Photivo also works with the best algorithm available in the market for organising, sorting, and finding necessary files from the browser. This includes gimp workflow and batch mode. It also works across different platforms like Linux, MAC and Windows. Even though it's bit tough to handle, once the methods involved to use this application are understood, then there's no looking back. GIMP workflow integration, CA correction, green equilibration, line de noise, bad pixel rectification, de noising wavelets median filters of RAW data, tone mapping are some of the commonly-used features of Photivo.

Why you must get it:

This application has completely new architecture of filters. Even though most of the photo editing softwares provide such features, still the features provided by Photivo are advanced and more user friendly.
