Pale Moon

Brief Description:

Pale Moon is an open-source web browser with customisable features. The motto of the developer of this web browser is to let the user design their web browser as per their wish. The browser is specially developed for Windows and Linux but also works on Mac OS X with the help of open-source code editing feature. Pale Moon looks like a stripped down version of FireFox. Pale Moon always works in single process mode unlike other web browsers. It has supports for XUL, XPCOM, and NPAPI plugins, which are not even supported by its father version.

Why you must get it:

One of the major reasons why users are fond of this web browser is because of its Control feature. The incoming and outgoing traffic of the current network will be noticed which will be higher than other common browsers like Chrome. Higher level of transparency is another great feature which attracts users to this browser. As the technology is getting developed to higher levels day by day, if the users want a quick and fast web browser in the high end processors, choosing Pale Moon is one of the best options to do. Secured browsing history and security from threats is other common feature found in this browser. The user can customise the start page as per their wish along with whole design of browser. Compiled plugins can be broken into different pieces under Pale Moon browser and used to run it.

Tor Browser

Brief Description:

Tor browser is based on the onion router. It is an open-source browser which allows people to anonymously browse the internet. The design of the router is called onion due to multiple-layer security which enables the user to feel safer when it comes to their data before reaching the final destination from the generated source. Tor primarily protects the users from Traffic analysis policy which can reveal one's personal identity and location to the hackers who are monitoring data at different points between the computer and the website that we wish to reach.

Why you must get it:

Even though Tor network is accessed by downloading it from the developer for free, once the user places the request for information in the browser, then a
