MPV**Brief Description:**

MPV is an open-source, cross platform video player that is designed with a minimalistic, graphical user interface and has rich features on the command line version. It features a minimalistic approach which enables its user to understand tricks for using the video player, which is how MPV got famous too. This is basically designed to work on popular and common OS like Windows, Android, Linux but it also works on the Ubuntu operating system as well. MPV is a powerful video player as it has the ability to play videos from the GNOME shell desktop too. GNOME MPV is not just a third-party MPV GUI front-end but they have been a slate of custom designer interfaces for Windows, Mac OS and Linux.

Why you must get it:

MPV is considered to be a clean and yet powerful video player. Displaying DVD menus, casting content to a Chromecast, etc. are some of the media handling features of this video player. MPV has its own salient features like improving the picture and sound quality to the maximum possible so that user doesn't feel strain after using this video player for long time. It sports a minimalistic GUI with few necessary controls and video codecs support. It even supports YouTube and other streaming command line along with support for subtitle while video is being played.

Miro**Brief Description:**

Miro is seemingly used like an alternative video player even though it has excellent features. However, once the user unleashes all its features, they won't regret using it. Miro has overhauled its application into a full featured media library which has a focused design to sync with Android software. Miro uses open protocols to let you subscribe to video channels and video blogs that are fed in via RSS, and uses BitTorrent to download the file. This is a great application for viewing both online and offline videos. The user can keep track of what kind of video quality they are going to have using this player for online streaming as the quality of video might change for every country.
