Thunderbird

Brief Description:

Mozilla Thunderbird is a cross platform, open-source e-mail client which is mainly developed to provide more secure email transactions for its clients and as a competition to beat the other professional e-mail clients like Microsoft Outlook and Eudora Mail. As Gmail is for Google Chrome, Mozilla Thunderbird is for Mozilla Firefox. This enables the users to connect and sync the details they

have in Firefox browser across all other devices that the e-mail is logged in. This email client supports add-ons like majority of the emailing clients and has the ability to allow extensions that provide additional functionality to other email.

Why you must get it:

As this email works on extension, one of the major key extensions of Thunderbird is Mozilla Lightning, an extension that works on calendar and engages the personal information manager's capabilities to Thunderbird. In this email application, the user can change the look and feel of the working environment as a wide range of skins are available from the latest version and lets the user change the theme to their wish at any time. It is a lightweight software which allows the user to configure their personal or professional account with their username and password. If any mails that are received are not needed in the Inbox folder but don't need to be deleted as well, then the user can save such
