ClamAV

Brief Description:

ClamAV is a cross-platform, open-source software antivirus toolkit that helps to find the different types of malicious software that could host the virus. It is extremely important to use this kind of software in email services. This kind of application has been developed for the Unix. It is the third party of the version that is available for Mac OS, OSF, Solaris, HP-UX, AIX, Linux, and the BSD.

Why you must get it:

ClamAV can be used for many purposes like automatic database updater, command-line scanner, and multi-threaded daemon that can be expanded and run as an antivirus engine from shared libraries. It helps find files such as unofficial mails. ClamAV are mostly used by the administrator systems for filtering e-mails or messages. By detecting these, the groups must be scored rather than causing the outright block of messages that are infected.

The data base of the ClamAV is updated every four hours. This software also supports files like RAR, Zip, CHM, Tar, Ole2, Bzip2, Cabinet, SIS formats, BinHex and other mail formats like ELF executables, portables Executable files that
