Pitivi

Brief Description:

Pitivi or PiTiVi is an open-source software used for the non-linear video editing on Linux. It is developed by different contributors. It supports some simple features such as snapping, splitting, trimming and cutting clips. This kind of software will allow mixing of audio and video which can be linked together. Pitivi is one of the very first free software for editing videos which supports MEF i.e., Material Exchange Format. It is user-friendly since it gives options of dragging and dropping manipulates directly, navigation of native theme and reduces complexity. With the help of this, the software can translate into various languages.

Why you must get it:

It has some features of supporting media editing that is very simple like, snapping, cutting the clips, trimming, and splitting. The audio mixing can be supported by the curves that visualizes as line segments that are drawn over the waveform of the audio. It has the ability for stepping into a piece of media with the help of keyboard shortcuts, or scrubbers. The ability to link both audio as well as video clips and the ability to treat it as a single video clip as well. The
