WordPress

Brief Description:

WordPress is a free software that is meant for content management and it is based on PHP and MySQL. It is widely-used in CMS software around the world and is 30 per cent more powerful than the top 10 million websites.

WordPress began its blogging system in the year 2003 and it has evolved to be used as a full system of content management.

Why you must get it:

It is free to install, upgrade and deploy. There are thousands of plugins and templates and it is flexible with a simple interface. It can reduce development costs and the time of deployment. It is open-source so it has room for expansion. It also has flexibility in the creation and modification of layouts. Users can customise it according to their needs. Most of the components in the interface are easy-to-use and there are manuals that are recorded and written to let people know how exactly to use it. Additionally, WordPress can allow users to maintain the process of customisation and reduce maintenance costs.
