

and community support in which rare doubts can be raised and sorted. This software supports auto-fill of all web forms under one hot-key, reducing the user's effort in accessing the app every time to find their password. This also helps in distinguishing passwords by making a tree of groups and sub groups for better management of passwords.

Bitwarden

Brief Description:

Bitwarden is a password manager which is completely open-sourced. Open-source software are considered to be secure applications as even minor errors or security patches can be rectified immediately, if noticed, as the source code of this software can be viewed and edited by anyone. This also has reassuring features like not storing the passwords in its original format. This program encrypts every password and such encrypted copies are visible to users. It encrypts passwords even before uploading them into the cloud server so that user can access their password from any device. Bitwarden has covered up its features across all OS platforms like Windows, Linux and Mac etc., even web browsers like Chrome, Firefox as passwords are most needed while accessing data from web pages.

Why you must get it:

This is a comprehensive app which has a user-friendly interface with familiar functionality throughout all platforms in both, desktop and mobile. This app supports 2FA and all features that are essential for cloud sync to happen between devices using end-to-end 256 bit AES encryption for higher security. Bitwarden has password checks and notification in its app to encourage the user to set up a master password and provide extra security to stored data. This program provides auto fill functionality which lets users apply passwords automatically by using master key password and doesn't let malicious intruders steal auto fill data by providing embedded frames.

Passbolt

Brief Description:

Passbolt is an open-source, freeware password manager providing privacy for users' saved data. The main focus of this password manager is to share data securely and increasing the productivity by making it easier to centralise passwords among others, especially between employees. The major difference compared to other password managers is the shared password
