

system within a particular network whereas other common password managers don't let the password data be shared with others. Passbolt is secure against root access as it is hosted in VPS which doesn't allow any kind of attacks. This software is based on OpenPGP, which is one of the familiar and proven cryptographic methods for encrypting data.

Why you must get it:

Passbolt is a supporting office-based password manager software where passwords can be shared securely amongst employees. This software runs with an access to its own server so that no intruders can hack it easily and steal the data. As this is an open-source program, anyone can improvise security features and share back those changes. The user interface of this application is easy to use both for novices and experienced ones. As this is mainly used between teams, it helps enforce management policies inside any structure of an organisation. This program is extensible to RESTful API. Installing and updating processes are easy to do as well.

Psono

Brief Description:

Psono is a web-based password manager which is mainly developed for team sharing purpose rather than being used by an individual. This offers all the basic features which a common desktop-based password manager will provide along with secure sharing properties. This program works on the Psono
