

server. This is an open-source software, so if any errors pokes up, they can be corrected by an expert, so this software keeps working without any hazard. This app allows user to organize passwords according to their desired custom groups and are encrypted locally. The password data will be synced and backed up within the vault automatically to the server system, so nothing goes missing in case something goes wrong. The main purpose of this password manager is to work on Windows OS but now it is adaptable even too Ubuntu, Debian and FreeBSD operating systems.

Why you must get it:

One of the major advantage of using this password manager is automated discovery of the needed password rather than searching manually. This app allows the user to scan, identify, and profile all assets and application with auto-onboarding of privileged accounts. Password Safe provides an integrated approach to make sure that the connection is secure and automatically checks for privileged credentials by recording the while session for secure third party vendor access. This provides password management as safe storage and session management for cloud-based administrative credentials like GoGrid, Amazon etc. and even auto fill forms from the social media sites like Twitter, LinkedIn and so on, with a strong password control policy.
