

which are present to do basic editing, this software mainly concentrates on advanced features. GIMP is a user friendly software which includes all the sophisticated tools that attract graphic designers, photographers, and illustrators to get their job done with ease along with enhancing images. As it's an open source software, it allows anyone to edit or modify the core code and include new plugins, which is don't need any kind of approval from the main development team.

LightZone Brief Description:

Lightzone is a commercial software in which light room works are focused on primarily. This is an alternative for the Adobe Light room since it also converts RAW files into digital camera supportive formats. It has a clean and stylish interface with a dark theme, which is essentially what made it popular among the image editing apps.

The software interface is split into two distinct sections - a browse window for navigating through the files in your system and an editing window which enables the user to work on images in the specific area.

LightZone is a pro level photo editor software which provides simple yet detailed editing by handing the full control access to the user. The set up is intuitive and allows users to easily adapt to the working environment. Unlike other software, it doesn't allow sharing through email or other methods, as it gives complete access to the system organizer so that the users can share from there.
