Trac

Brief description:

Trac is an open-source, web-based bug tracking software that has been adopted by multiple organisations. It allows accurate and advanced bug tracking features for free. It integrates with major version control systems which include Subversion and Git. The program has been written in the Python programming language. It is available on all major operating systems like Windows, MAC OS X and Linux. Along with bug tracking, this app is also a project management tool. It has a minimalist design but certainly doesn't lack any features. Customised reports can be generated from parametric stored SQL queries or using interactive ticket query system. It tracks bugs in your system efficiently and allows you to be at peace without having to worry too much about the security of your device.

92

Redmine

Brief description:

Similar to Trac, Redmine is a web-based, open-source bug tracking and project management tool. It seems to be a trend to combine these two. However, it seems to have many more features that transcend just plain old bug tracking. Redmine is used by many web development teams across the world for its bug tracking and project management features. It can be used to track looming bugs in systems and to let the workflow go about seamlessly.

WebIssues

Brief description:

WebIssues is an open-source, cross-platform bug or issue tracking system. It is clearly focused on issues management and tracking in the system that is owned by individual users or entire organisations. The software has a clean interface and focuses on the main issue instead of adding frills. Even though this is one of the less popular bug tracking software, it is quite capable of doing this task capably. It can be used to store, share and track issues with several different attributes, description, comments and file attachments. This software is even available as a mobile app.
