

TestDisk

Brief Description:

TestDisk is a free software for recovering data and it has been licensed under the terms of GNU General Public License or the GPL. During the initial stage it was created to recover data that is lost in storage partitions and to make a non-booting disks into bootable again. These are done when there are any kind of symptoms like viruses, human errors, or software issues. TestDisk can repair any errors in the Partition table. In simple words this software can be used to recover the partitions that are lost from the disk.

Why you must get it:

It has some features for both experts as well as novices. For the ones who know little or nothing about the data recovery techniques, TestDisk can be used for collecting detailed information regarding the non-booting drive that can be sent to tech in order to analyse it further. There are some more procedures that

are familiar with TestDisk as a handy tool for performing it onsite as a recovery.

It can be supported operating systems like DOS, Microsoft Windows, Linux, FreeBSD, OpenBSD, NetBSD, Mac OS X, and SunOS. The users can recover files which are in file systems like BSD disklabel, HFS, HFSX, HFS+, Hierarchical file system, Linux, XFS, SGI's journaled system of file etc. **d**
