

Why you must get it:

Firebird will support many kinds of hardware and software platforms like Windows, Linux, MacOS, HP-UX, Solaris and AIX. It will run on up to x386, PowerPC and x64 and other hardware platforms. Firebird will also include integration with CentOS, Fedora, Mandriva and Ubuntu. The software will provide users a multi-generation architecture. It will powerful and is developed on the friendly language of SQL. It has higher compatibility with an ANSI SQL

**Impala****Brief Description:**

Impala is an MPP or a massively parallel processing SQL engine query which is for the data that is stored on the computer cluster than is running on the apache Hadoop. Impala is described as an open-source that is equivalent to the Google F1, which has been inspired by the development that has been done in 2012. It has the ability to get scallable parallel database of the technology for Hadoop. This allows the users to issue low latency of the SQL queries to the data that has been stored in the HDFSD and the Apache HBase without the need of data moment or transformation.

This software has been implemented with Hadoop in order to use the same data format and files, metadata, resource management framework, which has been used by the MapReduce, and other Hadoop software.

Why you must get it:

Some features of this software are – it supports the HDFS and the storage of Apache Hbase, it can read the file formats of Hadoop which includes the text, Avro, Parquet, RCFile, SequenceFile, and the LZO. The results are in the large-scale data of processing and the interactive queries can be made on the same systems with the help of the same data. The metadata removes the need for migrating the sets of the data in the specialized systems or the formats into the analysis of the performance.

**MariaDB****Brief Description:**

MariaDB is one of the most famous servers for database in the world. It is created by the original developer of MySQL and has been guaranteed to stay in open-source. MariaDB is licensed under LGPL, BSD, and GPL.

Users like Wikipedia, Google and Wordpress.com have used this software. MariaDB will turn the data into a structured information in a wide range of
