

GNOME 3.32 has been incorporated

ran behind the scenes. Tracker is widely used as an indexing tool, which meant it played a major role in storing metadata for searches throughout GNOME. In 19.04, you have the option of using the batch rename tool along with metadata tags to enable file searching.

Fractional Scaling for HiDPI Displays

The GNOME desktop supports HiDPI scaling; however, the default options were limited in the previous versions. In other words, this has been a pain area for a lot of people using large monitors. The user has the option to choose between 100% to 200% scaling, which basically translates into too small or too big, whatever the case might be. There are a few experimental

Fractional scaling is an option, but a hidden one
