

hurdles to cross with the installation of the GNOME 3.32 which will mean that you would need to get a little experimental with your actions.

The problems with high resolutions are that the icons, GUI elements and text sizes are of the same height and width in pixels. While this composition might work on small and medium resolutions, it will tend to default in a large screen. If scaling out of the box is a requirement, then you can use the Wayland or Xorg graphical server to get more options for your screen. You can also use fractional scaling with the X11 session on Ubuntu 19.04, thanks to the smarts of Marco Trevisan.

Linux 5.0

Linux 5.0, which has brought about a major upgrade to the existing Operating Systems, includes some of the following features:

- NVIDIA Xavier display support
- AMD FreeSync support
- Intel Icelake Gen11 graphic support improvements
- ASpeed video engine support
- Initial support for NVIDIA Turing GPUs
- Initial support for NXP i.MX8 SoCs
- ARM big.LITTLE Energy Aware Scheduling
- NVIDIA Tegra suspend-and-resume for X2 and Xavier SoCs
- POWER On-Chip Controller driver support
- Fscrypt Adiantum support
- Improved AMD CPU microcode handling
- Binderfs implementation
- EXT4 and XFS fixes
- Retpoline overhead reduction work
- Aquantia AQtion USB to 2.5/5Gb Ethernet adapter support

Performance improvements worth looking out for

With the introduction of GNOME 3.32, the performance improvements are what considered to be the key headlines. The developers have included the GNOME Shell and Mutter to provide the users with a speedy experience. As a result, different windows have been tuned to respond in a more efficient manner to user clicks. With all performances in place, Gnome has started using lesser CPU power and is quite responsive to all changes.

However, if GNOME has been lagging on your system, chances are your drivers need to be updated. At the same time, while upgrading to 19.04, make
