

for most applications, it can be a nuisance for some apps on the Linux Operating Systems.

Since the Linux Kernel is the base controller of your operating system, you would need to restart the machine for the upgrade changes to be logged into the memory, before the effects can become permanent. With the launch of the Linux 5.0, there has been a work around for this problem. Livepatch, in the Software & Updates section, allows you to avoid rebooting your machine, especially when it relates to upgrading of certain applications.

This will not stop you from being transported to the 18.04 Livepatch feature, which was a major feature in the previous OS. But the backporting feature is only supported by the LTS version and is not readily available with the 19.04 version.

Bid adieu to applications menu

With the introduction of the GNOME 3.32, the removal of the application menu has been planned. The application menu has had a series of long running issues which were plaguing the previous Operating Systems versions. All application menus will return to the in-app windows, as used to be the case before when the removal comes into effect.

Android Integration is just a rumor

Android integration was supposed to find a way into Ubuntu 19.04; however, that could not be further from the truth. This integration would have happened as a part of the GSConnect, but nothing has been introduced in

Android integration isn't a part of 19.04, but might feature in 19.10
