Starting with the Basic Commands

Let us look at some of the basic Command Line Script which will help you get started with Command Line Programming in Terminal while you are using Ubuntu.

sudo: The sudo command is used to execute commands with Administrative privileges, this command is especially used while working with files and directories not owned by a particular account. You can type sudo, and then you'll be required to type the password. This way, only those with administrative privileges can make changes in the file/ directory.

Note: It is to be noted that while using Administrative Commands you should be really clear of what you are doing because you might end up damaging your system. If you are a beginner, abstain from using sudo for every application.

File and Directory Commands

As with any modern day operating system, Files and Directories in Linux sit on the core of its fundamental design and these pave the way to visualise as well as manipulate your system space. Learning to manipulate file systems and modify files is essential for your development as a master Linux programmer.

1. Touch

Touch is one of the most basic, yet important commands in Linux Command. It is used for creating empty files. By using this command, you can create empty directories as per the requirement of your write programs and choose to fill them later or immediately from within the terminal.

2. Cat

Cat command was designed to link different files simultaneously. Today it is used for numerous purposes. Among other commands, you'll also use this one to create files, view file content and redirect output to other tools.

3. head

The head command is used to view the beginning of a file or piped data from within the terminal itself. Popularly used by those involved in text
