

processing, you can use this command to go through huge chunks of data really fast and increase your productivity.

4. tail

As it seems from the name itself, this one is a compliment of the previous command. tail command lets you view the ending of a file or piped data from within the terminal itself.

5. cp

Essentially the copy command of Linux, you can use this command to copy whole files and directories from within the terminal and move them from one folder to another. Just like Windows, you can't possibly function properly without this command in Linux.

6. mv

A supplement of cut operation in Graphic User Interface, mv command is used to move files and directories from one folder to another. You can also use it to rename files and directories.

7. comm

A command used for comparison, this can be used to compare the content of two or more files to look for the similarities and differences. This one is an essential tool for those involved in data processing.

8. cmp

Another essential command that is used for comparison, this one is used to make numerical comparison and print the result completely achieved in terminal itself. This, along with comm command, have become the most essential commands of Linux for comparison purposes.

9. alias

Mostly used by system admins, this command allows you to replace a word with another string within a file from terminal itself. With other functions, this command can also be used to customise shell and manipulate environment variables.

10. pwd

A handy command for new users, pwd stands for Print Work Directory.
