

This command essentially prints the current directory you are working in, making it simple for you to track when you feel lost in similar font and content of terminal.

11. ls

The ls command presents you the contents of a particular file or directory of your choosing. This command is widely used with pwd especially by the new users.

12. cd

The cd command will remain essential for your Linux stint no matter how long it lasts. Abbreviated for Change directory, this command lets you change your working directory simply by typing two letters hence making Terminal a bit less scary for newbies.

13. mkdir

Another essential Linux command, mkdir lets you create a directory wherever, in whichever folder you like from the coding lines of terminal itself. You just require the permissions to do the same.

14. rmdir

It stands for Remove Directory, as the same suggests, rmdir lets you delete or remove directory from wherever you like in your Linux system. Most people use rm command for this purpose, but even a small mistake while using rm can create chaos on your system. Therefore, for newbies, we recommend rmdir only.

15. mount

It is not necessary that as soon as you connect an external hardware like USB or SD card, your device will recognize it immediately. Contrarily, in most cases you have to mount them to let your system recognize it. It varies on a case-by-case basis. If your distro has all the default drivers baked in then you'll have no issues recognising drives.

16. df

This is an extremely important Linux command. df shows the amount of disk space on your file system. It is widely used by system administrators to monitor real-time server and network-oriented systems.
