

using parenthesis to find out yourself. You can also pipe the output of this command with other commands.

3. sort

As the name suggests, this command sorts your files in numerous orders like the ones you use by right click in GUI.

4. chmod

A very powerful command which is also known as security command, this command lets you change the access permission for system files and objects.

Some Vital Information about Command Line Scripts in Linux

Having basic understanding of Linux CLI will aid you in mastering Linux Shell programming and understanding it easily. That said, here is some vital information about Linux that will make you understand it better.

- All Linux OS function in Lower Case: The basic reason behind this is to make the OS simple and easy to utilize with least complications. While you can name files, directories and folders in Uppercase, all the coding and programming is done in lower case only.
- Be careful while using the rm command: as noted above rm contains more weight than rmdir and has the capacity to remove entire directories, files and folders full of information in one go. One character can create chaos in your system. Moreover, if any friend of yours jokingly tells you to try rm-rf/, do not try it at any cost. This command will wipe out your whole system much like rooting your hard drive, nothing will be left.
- Passwords are kept in dark: When logging into the Linux Server, you need to type your password, don't freak out when it doesn't show anything. This is done purposely by Linux creators to increase security as they assume that you know what you are typing when you enter your password. So it is just a security measure to keep your password safe while Linux takes account of every tap that you make on your keyboard.
- Mastering the very foundation of Linux is very important: Just like any other skill, mastering the foundation is important before moving on to the advanced level because if you don't know the basic commands and working, you'll have a hard time coding advanced tasks on Terminal. Terminal in itself is really confusing because of its monotonicity, don't make it more difficult for yourself by not doing the basics properly.
