

- Linux Web operations are free: Being an open source software means all the Linux Web operations you may perform are free so don't get scammed into buying an operating system, all of them are free to use. Linux is a community-based OS.

Off You Go

These are the commands, codes and information that were, in all respect, essential for you to be able explore the vast world of Unix Systems. Before you can venture on your own, you'll need to get these basics correct through trial and testing because while you can read fancy books and do numerous online courses, the best knowledge is gained through experience.

In the same spirit, we want you to give you some additional resources that will help you explore and answer your own questions yourself.

1. \$ less filename

If you want to know what's inside a particular file but are scared of messing it up, just use "less" to view the file without writing privileges.

2. \$ run filename

Once you have seen the file and are still confused, you can type "run" before the filename to see what it does without changing anything in your code or your output, you'll practically know what your files does.

3. \$ apropos keyword

If you are confused about what command to use in a certain situation, just use "apropos" and type the keyword to receive a list of relevant programs.

4. \$ man command_name

You can use "man" and type the name of the command you are confused about. It will open a whole manual of options that can be executed along with the command, and will also give you the comprehensive picture of what that command exactly does.

Conclusion

In the end, we would like to say that you can gain as much knowledge as you can, for as many things as you want if you have the will to do so. It is just this trial and error that will give you the much needed experience to excel at any software that relies on a Command Line Interface. **d**
