

VM vs Non-VM

maintenance. Thus, VMs have gotten rid of the “one server, one application” model which was prevalent early on.

Across industries, VMs have become the de facto system in IT services. You’d be shocked to learn that physical servers usually run only at 10-15% of capacity. With the use of VMs, the increase in capacity utilisation is manifold. A 2011 IDC (International Data Corporation) report showed a 40% reduction in costs for IT departments that adopted VMs. This is because companies no longer use so much space, with racks and racks of servers now replaced with VMs, the maintenance, cooling, energy and recovery costs all go down.

Hence, it’s a no-brainer that companies utilise Virtual Machines at such large scales. But, what’s in it for you? Why should regular desktop users adopt VMs? Let’s read on.

VMs for Personal Use

Here are the numerous ways that a Virtual Machine can benefit you:

- Get your hands dirty with a new OS/application
You can try out a new Operating System and get the gist of it. Ultimately, if you don’t like the OS, just delete the VM and continue using your host machine.
