

- **Geekbench GPU comparison**

The GPU is responsible for rendering images, animation etc on the computer, and responsible for boosting their performance. This is an overall comparison between the Graphics of the two systems.

- **FPS comparison while playing CounterStrike: Global Offensive**

This score compares the FPS (Frames-per-Second) of the game while on **KVM vs running in native Windows OS**

Conclusion

As is evident, there's little difference between the two scores, thus definitively proving that running this VM on a Linux distribution (like Ubuntu) is the same as running the Operating System natively, for most practical purposes.

We hope this chapter has given you a good idea of the concept of Virtual Machines, what they are useful for, and why running VMs on Linux (especially KVM) is one of the most efficient methods to emulate operating systems.

Hence, now you use multiple operating systems at once, and create whatever you've been dying to create. Best of Luck!
