Permissions and Ownership

An understanding of file permissions and ownership in Ubuntu can be extremely beneficial

As we all know Linux Ubuntu by design and definition is a multi-user operating system. In an enterprise, it is used by multiple people accessing the same system. Think about like this, if any user can access any file on the system wouldn't it be a risk?

This is the reason why Unix, and now Linux, have built-in security systems to prevent unauthorized people from accessing secured files and directories. This ensures that files and directories can only be accessed by those with required security clearance. So how does Linux define which file can be accessed by which user?
