

- **File Type:** This single character denoted the type of file. `.d` means it is a directory, `-` means it is a regular file and `l` means a symbolic link.
- **Permissions:** This field represents the various permissions for various users. We'll expand and understand this in detail in the following section.

Source: <https://linuxhandbook.com/linux-file-permissions/>

A pictorial representation explaining all the file permissions and ownerships.

- **Hard Link Counts:** This shows if the file has any hard links. The default count for this is 1.
- **User:** The username of the user who owns the particular file
- **Group:** It denoted the group that has access to this particular file. It is to be noted however that only one group can own a particular file
- **File Size:** The size of the particular file denoted in bytes
- **Modification time:** Modification time denotes the date and time when the file was last modified
- **File name:** As the name suggests, it denotes the name of the particular file or directory

Now that we have got the basic idea of how file permissions and ownership are represented, let's get into the details of how file permissions really work.

In the above image you saw the file permissions as something like `rwx-rw-r--`

Here, `r` denoted the read permission, `w` denotes the write permission and `x` denotes the execute permission for the particular owner or user.

Note: The permissions are always granted in the order of read, write and execute and the permission set follows the particular order of user, group and others.

If you take a look at the image on the next page, you will see that -

- The file has read, write and execute permission for user owner. To determine who is the user owner you can use the `ls-l` command for the particular file.
- This file has only read and write permission for group owner, which
