

GUI

To change the permissions for you file or directory through GUI, just right click on the selected file and select properties. You will see something similar to the following image

Source: <https://www.howtogeek.com/>

As you can see in the above image, you can change the access permissions for Owner, Group and others. As far as executing permissions are concerned, you just need to check the box given for “Allow executing file as program” and this will enable all three owner types to execute the file simultaneously.

Command Line

The best way to change the permissions is to use the `chmod` command. There are two ways to use the `chmod` to change the permission settings-

- Absolute mode
- Symbolic mode

*Just for fun: Earlier permissions used to be known as mode of access and hence the full form of `chmod` was the short form for “change of mode of access”.

Using `chmod` in Absolute mode to change permissions

In the absolute mode of `chmod` command to change permissions, permissions are represented in octal form of numerical system. In this mode,
