

are mentioned under different contexts for convenience. Let's dive deeper into the specifics of troubleshooting on Linux.

Specifics you will learn here-

In this chapter, you will learn to troubleshoot Linux under several prerequisites. Let's look over the different contexts covered here-

- >Reasons responsible for the possible errors
- >Hardware issues and malfunctioning
- >Troubleshooting under various heads
 - Network issue
 - Installing driver with GRUB
 - Regarding the command line
 - Using tail
- >Important commands for uninterrupted troubleshooting
- >Summary

Reasons responsible for possible errors

Before focusing entirely over the troubleshooting, let us pay a little attention to preliminary troubles. You have to understand that troubleshooting does not only adhere to usage of extensive commands but also understanding and troubleshooting hardware issues and extreme software complications. The reason behind malfunction can be an errors in the hardware, configuration or any other factor. Before looking at the problems in Linux when beginning the troubleshooting, it is very essential to know the major aspects associated with the malfunctioning. In the below-mentioned points, you will find a brief regarding the types of problems associated with the Linux server. First of all, consider a few of the questions-

- Is a web server installed properly?
- Have you checked the syntax web server configuration of your system?
- Have you checked the configured ports?
- Are you sure about the DNS services directing you to the place?
- Are you certain about the web server regarding index files?
- Do you have a backend database?
- Can your server pass the dynamic content to the processor?

You have to give consideration to these questions before starting the troubleshooting process because the solutions to the problem may lie in any one of them.
