

Non-functioning hardware

This is a brief about the major hardware malfunctioning. Let's have a closer look.

Problems in the hardware of Linux

Before actually diagnosing the hardware issues it is essential to align with the possibilities. There are different types of hardware issues and you can encounter any one of them. Let us learn about the types of hardware issues.

For example, the power supply being cut and the whole machine going down. Or you may have a poor graphics card, audio card or a defaulter memory chip. This leads to the screen resolution reverting back, no sound while playing music or any other complexities. Sometimes you may also get error messages over your screen under this defect.

Malfunctioning because of erratic hardware

Under this kind of malfunctioning, you don't get regular updates or message notifications like the former one. Thus, you won't be able to extract the appropriate conclusion or can correlate among the last few events. Malfunctioning associated with different types of errors represents different problems like data corruption, poor quality of performance or any other hardware or software disturbances.

Driver malfunctioning

Driver malfunctioning can be categorized under hardware malfunctioning as both of them ultimately mean the same. If you have attached irrelevant drivers in your system, then there are possibilities that no communication will occur at all. The other worst consequence is that the system can start behaving unpredictably. This malfunctioning is so severe that sometimes it can also cause total loss of multiple functions. For example - the appearance of a black screen, white screen, kernel crash or any other uncertainty that could cause the malfunctioning.

Troubleshooting of common Linux problems

The world is all peachy until you encounter pesky Linux troubles. It is very essential for the Linux administrators to actually understand the malfunctioning and how to prevent, or troubleshoot them. Before troubleshooting, it is important to know what issues are associated with modules, drivers, BIOS or hardware which can trigger malfunctioning.
