

Disco Dingo

These last few years have been magnificent for open-source software and when you speak of open-source software, one of the first things that comes to mind is Ubuntu. While Linux enthusiasts have been harping on about how it is way better than Windows since the very beginning, anyone who has used Linux would agree that it was not at all user-friendly. That's because Linux was being made by folks who were already adept with software and technology for similar-minded folks. Whereas other operating systems had UI and UX experts pondering over every silly aspect in order to make it more user-friendly. This was nearly a decade ago. Things have changed considerably over these years.

We have a lot more software and technology giants focused on open-source software. Their contributions have been sizable and therein came higher adoption. All the reasons that would have been seen as “cons” for Linux are slowly fading away. Can't use your favourite Windows software on Wine? No worries, there are more forks of Wine that are built specially to make these software run without hiccups. Take Proton for example, it's a variant of Wine that's made for enabling games to run better on Linux so that you have to spend less time figuring out how to configure it best for a particular game. Valve, the company behind Steam, itself is pushing for gaming on Linux. Also, both NVIDIA and AMD have been working hard to issue drivers for Linux at the same pace as they do for Windows. It should be noted that AMD is significantly more open than NVIDIA at the moment. So, you no longer have to wait for the latest software to be pushed onto Linux with the same frequency as Windows. It's already happening!
