

In case a graphical application lacks logs

Sometimes, it is observed, that most of the graphical applications cannot generate log files. To rectify this, all you need to do is run the application in the command line and follow the outputs. For example-

```
$ supertuxkart
Irrlicht Engine version 1.8.0 Linux 3.8.0-19-generic
#30-Ubuntu SMP Wed May 11
6:35:23 UTC 2013 x86_64 [FileManager] Data files will be fetched from:
'/usr/share/games/supertuxkart'
[FileManager] Addons files will be stored in
'/home/carla/.local/share/supertuxkart/addons'.
```

Ubuntu essentially requires the program to have one significant page for reference. If you find that there is no significant page then you can follow -h switch. The help menu will appear on the screen (like- supertuxkart -h). There could also be other reasons like you might be missing a library, there might be a conflict, or other consequences, which the outputs from the command line will highlight.

Troubleshooting network issues

Well, this is where you need to draw special attention, because what good a system doesn't have good network?

Network issues in Linux are one of the most troublesome instances. If you are unable to access the server then find some way to login to the web console with the help of a VNC network connection. After this, you have to check the internet connection of your server and use the ping command along with a public IP address.

The output which you will receive will clearly mention the interconnection accessibility. The command will be-

Even with the help of commands, if you cannot reach the destination, then there might be a possibility of an error in the configuration. In this

```
PING 8.8.8.8 (8.8.8.8) 56(84) bytes of data:
64 bytes from 8.8.8.8: icmp_seq=1 ttl=58 time=1.68 ms
64 bytes from 8.8.8.8: icmp_seq=2 ttl=58 time=1.70 ms
64 bytes from 8.8.8.8: icmp_seq=3 ttl=58 time=1.71 ms
64 bytes from 8.8.8.8: icmp_seq=4 ttl=58 time=1.69 ms

--- 8.8.8.8 ping statistics ---
4 packets transmitted, 4 received, 0% packet loss, time 300ms
```
