

And then closely observe the DNS records of the server

- `sudo cat / etc / resolve.conf`

## Most important commands for Linux networking

Commands or weapons for troubleshooting, decide yourself by knowing their utilities. Networking is the most important aspect of servers. In the list below, you will find commands which you can use for troubleshooting.

### Ifconfig command

In your network server if you want to configure the network interface utilities then this command can be used. The other benefit of this command is you can easily check the IP address which is assigned to your system. Have a close look over the command-

```
[root@localhost ~]# ifconfig -a
eno16777736: flags=4163<UP,BROADCAST,RUNNING,MULTICAST> mtu 1500
    ether 00:0c:29:c5:a5:61 txqueuelen 1000 (Ethernet)
    RX packets 0 bytes 0 (0.0 B)
    RX errors 0 dropped 0 overruns 0 frame 0
    TX packets 0 bytes 0 (0.0 B)
    TX errors 0 dropped 0 overruns 0 carrier 0 collisions 0
lo: flags=73<UP,LOOPBACK,RUNNING> mtu 65536
    inet 127.0.0.1 netmask 255.0.0.0
    inet6 ::1 prefixlen 128 scopeid 0x10<host>
    loop txqueuelen 0 (Local Loopback)
    RX packets 2 bytes 140 (140.0 B)
```

### Traceroute command

If you want to print the packets of the route to the host then you can use this command. The most essential utility required for it is destination host or IP address.

### Dig command

The command Dig or domain information groper is actually an efficient tool to interrogate the DNS name assigned to the server. With this command, you can also perform DNS lookup and can efficiently display the outputs available from the server name.

### Telnet command

With the help of this command, you can learn about the connection established between two hosts. Telnet is a protocol that makes a distinction between the established connections.
