

Mode through which you can easily see the new lines which are added in the file. The tail is also similar to the head utility which is used for seeing the file beginning. The syntax of the tail is-

- `tail example.txt`

Through this syntax, you can print 10 lines in sequence in regards to the output on the terminal. If you want to view a number of files then the specification is required for additional arguments or by using a wildcard.

- `tail example.txt example 2.txt`

If you want to view the end of all the files in a directory then-

- `tail *.log`

Follow mode option

If you want the command tail to operate in follow mode then you can do it with the help of -f option. You have to push a break in order to stop the tail to follow the file to the terminal using control +c. While troubleshooting, the follow mode is extremely useful as it allows the user to watch real Time logs. Tail command can also be used with 'grep' in order to filter the contents of the log file. With the help of this, you will be able to track the specific errors for example 404 responses.

Most essential commands

Using the below-mentioned command you can easily see where log files-

- Less command
- more command
- cat command
- grep command
- tail command
- zcat command

Further, you have to open the terminal or simply login. This has to be done as root user by using the command ssh. Then you have to follow /var/log directory by using the command cd-

- `# cd /var/log`

If you want to list the entire files then use the command

- `# ls`

If you want to view the usual log files called /var/log/messages then use any one command-

```
# less /var/log/messages
```

```
# more -f /var/log/messages
```
