

clean when you install SteamOS. If you want to play around with it in a non-destructive manner, do it with a virtual machine. When SteamOS is installed, a new partition is created which wipes your existing set up completely.

- **This wipes your secondary hard drives, too** - To be safe, you should remove all drives except the one you want to install SteamOS on, otherwise you risk losing data in your secondary hard drives as well since basic methods to categorise drives isn't available on Linux as on Microsoft. Therefore, instead of selecting a virtual drive in your system, you may select a physical hard drive which can wipe it altogether.
- **You'll need an NVIDIA graphics card.** There is no support for AMD users. It is reportedly coming in the future though.

There are a lot of platforms (OS) which offers playing games such as Windows PC, Linux, Xbox, and PlayStation. Linux users, contrary to

PlayOnLinux Installer

popular belief can easily play games on the OS with the help of native Linux games, browser games, Windows games, Terminal games, Steam and more.
