

between two consecutive LTS releases spread out evenly within that time period. These releases are not the most stable ones and are mostly aimed for enthusiasts and developers.

Which Should You Use?

The big question, Server or Desktop. Since they both are built on top of the same Linux kernel, the only major difference is the GUI and out of the box packages.

When to Use Ubuntu Desktop

Ubuntu has seen a massive growth in recent in terms of improvement in its UX and software compatibility. The usual claim that Linux not being user-friendly falls flat when it comes to Ubuntu. Ubuntu has a clean and sleek design with a dedicated app store so you never feel the need to switch to any other OS just because of the lack of dedicated applications. Ubuntu devs rarely fail to deliver updates regularly. So if you're looking for a daily driver then Ubuntu should be up there at the top of your list. Developed on top of a linux kernel has its own benefits. Linux distros including Ubuntu are able to deliver a smooth and powerful performance even on low-end hardware. Ubuntu can breathe new life into your grandma's age-old PC.

When to Use Ubuntu Server

The only major downside to Ubuntu Server against Ubuntu Desktop is the lack of a GUI but you can always add it later. In a world full where server OS's abounds, Ubuntu is one of your best bets. Ubuntu servers comes pre-installed with many default specialised packages. To conclude, for servers you're better off going with Ubuntu Server but if you necessarily need a GUI out of the box, Ubuntu Desktop won't disappoint you.

Installing Ubuntu Server

Installation Requirements

- ISO image of Ubuntu server 18.04 LTS
- 2 GHz Dual Core processor
- A minimum of 25 GB of hard disk space (SSD or HDD)
- Installation Media (Either DVD / USB drive)
- Internet access

Like every other OS you'll need a bootable image of the Ubuntu Server, the official name of the server edition OS.
