

Installing Apache

- `$ sudo apt-get install update`
- `$sudo apt-get install apache2`
- `$sudo service apache2 start #to test for successful installation`

Now, fire up your browser go to:

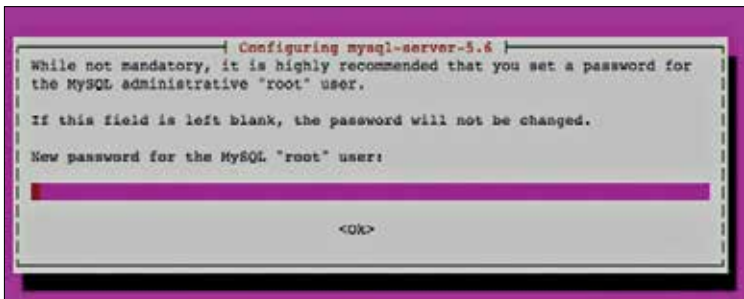

- `http://<your ip address>`

If everything went smoothly, this is what you'll see:

Installing MySQL

- `$ sudo apt-get install update`
- `$sudo apt-get install mysql-server mysql-client`

Run the above command in a terminal and give your confirmation when prompted.

Setting up MySQL

Set the password for the root user.

Securing your MySQL server

The out-of-the-box default settings for the server are not quite secure. To secure our server against attacks we need to re-configure it. Luckily this has also been made easy for us. Just a single line of code will do the trick.

- `$ sudo mysql_secure_installation`
