

This will prompt us to remove anonymous users, test our database and disable remote login. The root password will also be changed. After completion of this step our installation will be much more secure.

Testing our server

- `$ sudo mysql -u root -p`

Enter the root password which you created earlier. If you wish to create a database go with the following command.

- `$ Create database <databasename>`

Installing php

- `$ sudo apt-get install php libapache2-mod-php php-mysql`

Press 'Y' when prompted.

Testing the installation

- `$ sudo nano /var/www/html/info.php`

In the opened file, write the following test code.

- `<? php`
- `phpinfo();`
- `?>`

Restart Apache

- `$ sudo systemctl restart apache2`

Now find out your ip address and enter the web address:

- `<your IP address>/info.php`

You will see a php information page (image on the right) on if the installation was successful.

Installing WordPress

To download and extract the installation files execute the following commands in succession.

- `$ cd /tmp`
- `$ wget -c http://wordpress.org/latest.tar.gz`
- `$ tar -xzf latest.tar.gz`

Now move the folder to the server directory

- `$ sudo cp -R wordpress/* /var/www/html/`

Change the ownership privileges:

- `$ sudo chmod -R 755 /var/www/html/`
