

- `$ sudo systemctl status ufw`
- `$ sudo ufw status`

This will probably give you an output of 'inactive'.

Before activating the firewall out network traffic should be re-routed to pass through the firewall. To achieve this:

- `$ sudo ufw allow 2345/tcp`

Now the firewall can be enabled.

- `$ sudo ufw enable`
- `$ sudo ufw status`

And we're all set. **d**
