

WhatsApp analysis tool

To make it clearer, let's take an example of a local bakery which has 100 clients in its contact. Now, this bakery decides to launch a particular offer over two weeks and hence decides to engage the customers by sending them messages about the promotion. On getting the analysis they know that out of the total 400 messages sent to the 100 contacts over 2 weeks, all of them were delivered, while only 300 were read, and 75 replies came as a query and the conversion came down to 50 orders over this period.

Now the owner knows who are the ones who ordered and who are the ones who read at this time, and what he/she can do is change the content and start experimenting with people who haven't bought into the content that was sent while maintaining the

same content for those who responded by ordering or even replying. This way you can get into the crux of your content and know what the audience is buying and what they are not buying.

Conversion Tracking

Every marketer knows the importance of tracking the conversion rate for your marketing campaign and this is no different for WhatsApp as well. For those who don't know you can track your conversion by adding the Google Analytics for Click to chat plugin that is specifically designed for WhatsApp conversion rates. This plugin used using the Google Tag Manager and can track your website click rates which are generated from the links to your websites that you share on WhatsApp. Still, in its early stages, this technology gives users a free hand in setting the parameters and variables to track their conversion rates in a way that they are free to set their Event Tracking parameters.

For those involved in direct contact with their customers, like a cake shop that we shared about earlier, it is really easy to track their business conversion by using simple WhatsApp analytics tools and comparing the obtained statistics to the number of orders received and then calculating the conversion rate.
