

and will possibly power the next generation of smart gadgets, especially IoT. Fuchsia is something that Google is counting on. According to critics, it will enhance the working of Flutter, making both of these a powerful combination to work with. Developers are excited to try this pair to power their mobile applications. These two together will lead the way towards more rapid advancements in technology.

What is Google Fuchsia OS

When we talk about operating systems, especially the ones that are related to Google, there is just one that comes to mind prominently - Android. There was, in fact, a second operating system that Google had developed known as the Chrome OS. Fuchsia is the third operating system that is going to be launched by the company. Contrary to common belief, Google Fuchsia OS is not an upgrade of Chrome OS or Android OS. Instead, it is a standalone platform that follows a completely different framework. It is also interesting to note that, unlike Android and Chrome OS, Fuchsia is not a derivative of Linux.

Fuchsia is rumoured to be an OS suited best for IoT devices, slated to be released sometime later this year, or in the beginning of 2020. It is being designed to work across all devices. Once the user logs in using his or her Google account, the operating system will save itself on all the other devices. For example, if you had some music playing on your Google Home device, if you move out, the same song will resume on your phone or on your radio connected to Google. With Fuchsia, Google plans to take it up a notch higher.
