

Why did Google decide to launch Fuchsia?

Android uses the Linux kernel, which was not originally designed for phones. A kernel is the heart of any operating system, lending it its primary method of functionality. Android, owing to the Linux kernel that is used is a messy affair. The problem of fragmentation has ensued for a long time, now. It does not allow full usage of the hardware. Most issues related to the hardware of a system running on Android is due to this problem. Google's Fuchsia is supposed to overcome this issue of fragmentation to utilize the hardware of a system to its maximum capacity.

Android works differently for different companies. It is always slightly tailored or tweaked by the organization using it, before embedding it into their devices. As a result, Google is unable to push promotional messages to these devices, which in turn makes the entire system commercially unfit for the company.

The relationship between Flutter and Fuchsia

According to many critics, Flutter is actually paving a solid road for Fuchsia. Flutter, being an open source, cross-platform app building software that it is, is preparing the market for an operating system is that will make the software even more efficient.

Fuchsia will give Flutter an enhancement that will attract the programmer's community towards it. Together, they are prophesied to make a special duo with powerful attributes and revolutionary performance.

The layers of Fuchsia OS

Google has described Fuchsia OS as a 'layered cake', which comprises of four layers or tiers to it. All four of these layers, as mentioned by the company, are described below.
