

be visible to the user and will take care of the front end of the scenario. Ledger is the component that is responsible for keeping track of all the information across all connected devices. Maxwell will be the brain of Fuchsia, taking care of its intelligence.

4. **Topaz:** The fourth or the top-most layer of Fuchsia will contain all the apps that the user will utilise. It will predominantly provide support to the entire system.

Key benefits of Flutter

Needless to say, with the package that Flutter brings to the developers, it has some tenacious attributes to keep them hooked. The advantages of this software, are plenty. Some of them are listed below.

1. **App development from a single codebase:** As has already been mentioned, it can get cumbersome to design applications separately for all the leading platforms, like Android and iOS. Hence, the entire procedure can be quite time-consuming. This issue is solved by Flutter. Developers can use a common codebase to design apps for the two most highly reckoned platforms. This proportionally reduces the turnaround time, giving rise to more applications for smartphones.
2. **Expressive language:** Flutter is highly acclaimed for its easy and expressive language. It allows programmers to use minimum resources while producing maximum productivity. Its declarative approach combines with its language to make Flutter a powerful tool.
3. **Extensive library:** Unlike other platforms that the programmers have
