

Pre-requisites

The prerequisites of Flutter are not overwhelming in any way. As a user, you will need to be aware of the kind of OS that you already use. It can be any version of Windows, preferably one of the latest versions though, any version of MacOS, or Chrome OS. Things vary a little for Chrome OS as it is Google's own. In addition, you must also have a disk space of 400 MB, without which, Flutter cannot be installed.

Installation

The process to install Flutter is simple. While different operating systems have different steps of installation, the process is almost the same with slight changes. These steps are found anywhere on the Internet. As it is an open source, users can download and install Flutter for free.

Setting up your editor

Although Flutter allows the programmers to use any text editor, Google recommends using one of their editing plugins. Needless to say, accessing becomes better with that. The plugins are designed to give the developers a number of features, including completion of code, highlighting syntaxes, assistance in editing widgets, and such similar features.
