

Ever since its inception in 1998, it has seen exponential growth and has been a pioneer in providing a vast array of services. It offers Google Search as its basic search engine along with Google Docs, Google Sheets, and Google Slides for work and productivity. Email services are provided through Gmail, cloud storage through Google Drive, and instant messaging apps like Allo Duo and Hangouts help keep in touch with one and all. Adding to the long list of ingenious apps by Google are language translation aid, Google Translate, navigation assistants Google Maps, Google Earth and Google Street View, and photo storage and editing through Google Photos. This list is not even close to comprising a comprehensive list of Google's products, which seems to be dabbling with the entire cosmos at the moment.

And just when you thought Google couldn't surpass what it has already accomplished, Google brings to you Flutter, an open-source mobile application development framework. Flutter is a comprehensive kit that can be used for the creation and development of applications for Android and iOS. Moreover, it is also a primary method of creating applications for Google Fuchsia, which is an open-source capability-based operating system.

Long story short:

Flutter was first unveiled in 2015 at the Dart developer summit. Then, it was codenamed 'Sky' and was operational on the Android operating system. In December 2018, the first 'stable' version of the framework, dubbed Flutter 1.0, was released.
