

Basic Overview:

Flutter comprises of four key components:

- **Dart platform:** Flutter applications are written in Dart language and further make use of a number of the language's complicated features.
- **Flutter engine:** This is written in C++ provides a kind of low-level support. It makes use of Google's Skia graphics library.
- **Foundation library:** The foundation library, written in Dart, provides the basic functions which are used in the development of applications.
- **Design-specific widgets:** The Flutter framework comprises of two types of widgets: Material design widgets which make use of Google's design language and Cupertino widgets which emulate the design of iOS.

Having now, a basic idea of the overall structure of Flutter, we shall move on to understanding the services which Flutter has to offer that include its UI, Data and Backend, Accessibility and Internalization, Platform Integration, Packages and Plugins, and Tools and techniques. Let us take a look at them one by one.

User Interface

"A picture is worth a thousand words. An interface is worth a thousand pictures."

–Ben Shneiderman

UI is perhaps the crux of Flutter, as it is even marketed as 'Google's UI toolkit.' The platform is a one-stop solution for building interactive,
