

creatively visualized and uncluttered UIs for applications compatible with web, desktop, and mobile. The ‘Hot Reload’ feature lends the process speed and lets you make the most out of the end-user-centric-services on Flutter.

All the Widgets You Shall Ever Need

The widgets Flutter offers are built using a modern framework, which in turn is based off React. The basic idea is that of making one’s UI out of these widgets. So the widgets describe how they should look like, taking into view their present configuration. As this configuration of widgets changes, they likewise change their description.

Flutter provides several widgets of which the most commonly used are text, row, and column, stack and container widgets. Flutter also provides us with a host of other widgets which help us build apps that follow Material Designs. Such widgets are called MaterialApp widgets, and they help build several other useful widgets at the base of one’s app, including a

Flutter material theme editor

Navigator. The Navigator is responsible for changing one screen to another in the application. Usage of the MaterialApp widget is optional. However, it always provides unique results.

Another important widget is the Scaffold widget, which takes several different widgets named ‘arguments’. These are then placed appropriately in the Scaffold layout.
