

Formatting the Code

One's code is free to follow any style. However, developers, more often than not, find it more productive to have a single, shared style and the enforcement of this style through automatic formatting. This alternative is very tiring, and one may like to spend one's time on code behavior rather than code style. However, one can automatically format code in Android Studio and IntelliJ, VS Code, and through Flutter commands.

Parting Words

It is self-conclusive by now that Flutter provides an array of services to facilitate smooth app building: from a great number of widgets to an inundating figure of packages, Flutter has it all that needs for effective app development. Come explore Flutter today and be a master of your vision. **d**
