

features of the newer Android versions. This is fine but if your audience is such that they do want some kind of modernisation and features then it might turn them off.

- Contrarily, if your `minSdkVersion` number is too high then it might exclude lower versions of Android which means you'll experience a loss in audience from those who use older devices.

No sane developer wants to eliminate users simply because they don't have the latest and the best Android devices, so to reach more users keep your `minSdkVersion` at an average value so that you can use the features as well as reach the maximum audience with your application.

Note: While you are in the process of creating a project, the Target Android Device dialog box contains a 'Help Me Choose Link'. When you click on the same, you will see the percentage of Android Devices running on various versions of the software. So after getting this important piece of information, you can always choose to have a middle ground between technology and population while deciding the `minSdkVersion` of your Android Application.

Setting your App's own version code and version name

After you create a new project on Android Studio, some default attributes are put into your `build.gradle` file. These attributes are `versionCode` and `versionName` fields.

The versions code must always be an integer and it should always increase over time. If you are wondering if version code is an integer then what is that the users see, well that is version name. You can use notations

Setting your app's version name and version code
