

- Take a look at the content in your `jni/`, `lib/`, and `src/` directories: The `jni/` directory must only contain the content that is associated with Android NDK such as `.c`, `.cpp`, `.h`, and `mk` files while the `lib/` directory should only consist of the third-party library files or private library files which also includes prebuilt shared as well static libraries. Lastly, the `src/` directory as the name suggests should contain only the source files for your application (`.java` and `aidl` files).

Note: `Src/` directory shouldn't have `.jar` files

- Scope your project for any private or proprietary files that your app isn't using and immediately remove them.
- If there are any test libraries in your `lib/` directory that you aren't under use, immediately remove them.

Review, update manifest build settings

You need to verify that the following manifest settings are set correctly

- `<uses-permission>` element

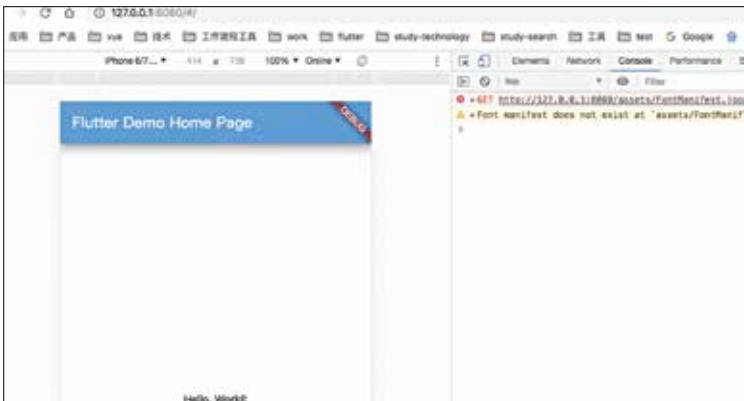

Only specify the conditions that are needed and necessary for your application.

- `Android : icon` and `android : label` attributes

Specify values for these attributes located in the `<application>` element.

- `Android : versionCode` and `android : versionName` attributes.

We suggest you to specify values for these attributes that are located in the `<manifest>` element. You can also take a look at [Versioning your Application](#) for more information

`<manifest>` element
