

There are many other manifest or build file elements that you can set for your application if you are releasing it on Google Play.

The `android: minSdkVersion` and `android:targetSdkVersion` attributes, which are located in the `<uses-sdk>` element.

Addressing compatibility issues in your application

You can use a whole variety of tools in the Android Dev environment which are dedicated to making your apps more compatible and accessible for the widest range of devices possible.

To ensure that you are using all these tools properly, here are some steps you can follow which will ensure maximum compatibility for the applications you have created.

- Adding additional screen support for multiple screen configurations across devices.

Make sure you have a look at the best practices for screen configuration and try to meet the maximum out of the lot because by having an additional screen support your application will be able to support multiple screen dimensions that are used across the Android platform.

- Optimise the application for tablets

In the case that your application is designed to be compatible with devices on a version older than Android 3.0, be sure to make it compatible with tablet-friendly Android 3.0 devices. You can do so simply by following the guidelines and best practices described under the title *Optimizing Apps for Android 3.0*.

- Consider using the Support Library

In the case that your application is designed for devices running on Android 3.0 or higher, ensure that your application is compatible with older versions of Android.

You can do so by adding the Support Library feature to your application project. The Support Library feature provides you with static support libraries that can be added to your Android Application so that it enables your Application to use APIs that are either not available in older version or use utility APIs that are not a part of the default framework APIs.

There is a specific publishing method that one has to carry out so as to publish an app on the various platforms. The steps for the publication of your application on Google Play likewise as IOS App Store are given in the following page:-
